

CONSTRUX

The record that cannot be argued with.

One governed record of a project — concept to the thirtieth year — on an append-only, hash-chained ledger. Every entry attributable. Every state replayable. Tampering detected, not just discouraged.

The construction operating system · construxvg.com

PROJECT_CREATED → ... → HANDOVER_ACCEPTED chain head sha256:4f9c1e...a37b verified

THE PROBLEM

Nobody loses money because they did not work hard.

They lose it because the record of what was agreed, when, and on what basis is scattered across email, spreadsheets and somebody's memory of a site meeting.

1

Late, not missing

The revision that changed the pipework interface was issued on time — and reached the people pouring concrete a fortnight after they needed it.

2

Risk found after it cost money

A register reviewed monthly finds a risk that landed three weeks ago. By then it is not a risk. It is a variation, and the argument is about who pays.

3

Your best people, chasing updates

The most expensive managers on the job, reduced to a human integration layer between systems that will not talk to each other.

WHY NOW

This one is not a preference. It is a statutory duty with a date.

12,500

higher-risk buildings in England

Broadly: residential at 18m or seven storeys with two or more units, plus care homes and hospitals in scope at design and construction. Duty-holders must produce the golden thread at every Gateway.

What the guidance asks of the software itself

- Every entry attributable to a named user
- Timestamped
- Immutable, with historical states preserved
- Tenant isolation, documented encryption, UK residency
- Annual independent penetration testing

That is a specification of our architecture, published by somebody else.

THE DIFFERENCE

Version history is a change log. It is not an immutable record.

Retrofitting an append-only ledger under a CDE built on mutable documents is not a feature. It is a rewrite.

	TYPICAL VENDOR	CONSTRUX
Attributable	User stamped on a document version	Every state change is an event with a named actor
Immutable	Version history you can delete	Hash-chained, append-only. Nothing is edited
Tamper-evident	Not claimed	Replay detects alteration and names the event
Separation of duties	Advisory workflow	Refused, not warned
AI governance	“AI-powered”	No agent can approve anything, by construction

a change log on a mutable file is not an immutable record

THE DEMO, IN ORDER

Three things nobody else can do on stage.

1

Tamper. Then catch it.

Alter a record in front of them. Run the replay. The root hash moves and the platform names the exact event that changed.

2

Sign in as the regulator.

Every write control disappears. The export still works. Read-only oversight is architectural, not a checkbox somebody ticked.

3

Certify your own application.

The platform refuses. Separation of duties is enforced in the event catalogue, not advised in a workflow.

Only then show the AI. Lead with the ledger and the AI becomes credible because it cannot act alone.

run the replay · root hash moves · the event is named

Agents propose. A named human decides.

Eighty-one agents read the project and raise work. Not one of them can approve anything — the event catalogue refuses an AI-authored approval outright, and no agent mandate exceeds PROPOSE.

81

agents across every
capability area

0

that can approve,
certify or sign

100%

of AI spend priced
before you commit

Every

answer names its
sources and its gaps

No AI action runs without showing its estimated cost first — and the wallet is prepaid, so it cannot run away with your money.

Compliance opens the door. Cashflow closes the deal.

Not every buyer cares about the Act. Every buyer cares about being paid. The statutory payment regime is date-driven and unforgiving, and the platform computes the dates rather than reminding you to.

Over-certification	REFUSED
Double certification	REFUSED
Overpayment	REFUSED
A withheld sum	MUST CARRY A REASON

“One disputed payment notice costs more than a year of the licence.”

— the line that closes commercial directors

WHAT IS ACTUALLY BUILT

Not a roadmap. A running platform.

1,135

API ROUTES

777 writes, 358 reads — every
one authorised server-side

761

EVENT TYPES

A closed catalogue. Nothing
writes a state the catalogue
does not name

11

LIFECYCLE STAGES

Concept, design, tender,
construction, commissioning,
handover, thirty years of
operation

6,364

TESTS PASSING

Including invariants that fail the
build if a screen or a door goes
missing

Installs to the home screen. Works with no signal. The site diary is four fields.

zero runtime dependencies · 6,364 tests passing · typecheck clean

PRICING

Start on one project. Not on a transformation programme.

Solo

£100

per month

1 seat

Sole traders and single-project consultants

MOST START HERE

Core Project

£950

per month

10 seats

SME contractors and pilot projects

Professional

£2,200

per month

25 seats

Active contractors running multiple packages

Enterprise

£6,500

per month

Unlimited

Tier 1 and multi-portfolio, isolated tenancy

Site supervisor seats £70. Subcontractor access £25. AI is prepaid and priced before every run — never a surprise line on an invoice.

per month · cancel from the console · your record exports as a signed, hash-verified event log

THE TWO YOU WILL ALWAYS BE ASKED

Answered plainly.

“We already have Procore, Asite, Viewpoint.”

Keep it. We are not your CDE. We are the governed record underneath it — and we can start on one building without touching the rest of your estate.

“You are a startup. What if you disappear?”

Your record exports at any time as a signed, hash-verified event log, and escrow is in the contract. You are not renting your compliance evidence from us.

Built by Justin Nseyia, MCIOB — from twenty years of meeting the same failure on project after project. It was not designed from a market gap.

export: signed, hash-verified event log · escrow in the contract

Fifteen minutes. Your project. Your record.

We will take one of your buildings, stand the record up in front of you, alter it on purpose, and let the platform catch us.
