

CONSTRUX

Stop losing money you have already earned.

The AI construction operating system that computes your contract on the day it moves — not four weeks later, when the money has already gone.

Sole trader to Tier 1. One record. Concept to year thirty.

construxvg.com

EVERY JOB, EVERY MONTH

Three ways the money walks out.

1

Miss the notice

Miss the pay less window and the application is payable in full. Not argued. Payable.

2

Lose the claim

Delay you cannot evidence on the day is delay you absorb. Nobody pays for it later.

3

Find out late

Four weeks between the event and the review. The margin is gone before the meeting.

These are not software problems. They are counting problems.

ONE APPLICATION. ONE NOTICE. ONE DAY.

£119,650

**protected on a single valuation,
because something was counting the
window.**

Handrail terminations not to detail. Dewatering rates not agreed. Both were already on the record from site — so the platform priced the withholding, drafted the notice and served it inside the window, on the day.

APPLIED

£2,248,650

WITHHELD

—£119,650

NOTICE

in the window

NOTIFIED SUM

£2,129,000

From the demonstration project on our site, which you can walk through before you sign up. A worked example, not a customer outcome.

Your cost report is a rumour.

A number somebody keyed in, from a spreadsheet
somebody else keyed in, from a system that disagreed
with the first one. By the time anyone reconciles it, the
window has closed.

CONSTRUX has nothing to reconcile.

One append-only record of everything that happened.
Every figure on every screen is computed from it, so the
numbers cannot disagree — and each one walks back to
the photograph, the drawing revision or the signed
instruction it came from.

Hash-chained

Change a record and the chain breaks, visibly. Nobody
edits history here.

Append-only

A correction is a new entry, with a reason and a name
against it.

Replayable

“What did we know on the 14th?” still has an answer two
years later.

***This is what a Golden Thread was always
supposed to mean.***

CONCEPT TO YEAR THIRTY, ONE RECORD

Everyone else stops at handover.

Every other toolchain breaks here

Win it

Tender take-off, bid/no-bid on ten factors, and a red team that attacks your submission before the evaluator does.

Run it

Cost, programme, quality, safety and the site app on one spine. The final cost forecast moves when reality does.

Keep it

Handover packs, O&M and lifecycle cost — read off the same record that built the thing.

THE RULES YOU ARE JUDGED AGAINST

The Act does not care that you were busy.

1

Construction Act

HGCRA 1996

Notice windows counted from your contract's own dates. A missed window becomes an alarm before it becomes a loss.

2

CDM 2015

Principal Contractor

The duty set, the documents each duty needs and who holds it — built from the project record, not a template.

3

NEC4 · JCT · FIDIC

As amended

It reasons about your contract with your amendments applied, not the published form somebody filed away.

Deadlines are arithmetic. Let the machine do the arithmetic.

THE QUESTION YOUR CLIENT WILL ASK

AI you could put in front of an adjudicator.

● No agent acts on its own

Every mandate stops at propose. A test fails if an agent ever grants itself more.

● Every output is attributed

Which model, which evidence, whose approval, and exactly what changed.

● It refuses rather than invents

Ask for a number the record cannot support and it says so. That is the feature.

● Priced before it runs

You see what a run costs before you commit, and it draws on a wallet you cap.

“Who decided this?”

A decision no human can defend is a decision you lose — to a client, an adjudicator or an insurer.

So the agents read, draft and calculate. The authority stays with the person whose name goes against it. Governance decisions are human here by construction, not by policy.

BEFORE YOUR IT REVIEW ASKS

Built like something you have to trust.

0

runtime dependencies

Nothing third-party to patch at 3am. Your security review will be a short one.

6,721

automated tests

Every rule proved before it ships, not after a customer finds it.

785

event types, closed

Nothing happens on your job that the record cannot name.

1,185

API endpoints

Your data stays yours. Read all of it from your own systems.

Encrypted at rest, per customer. Second factor on every administrator. Your tenancy cannot see anybody else's.

ONE PERSON, OR TEN THOUSAND

From £100 a month. Same record.

per month

Unlimited

Tier 1, isolated tenancy

Put the whole supply chain on it. Pay only for the people who decide.

Site, quality, design and trade participants are admitted without a seat. Every package includes AI credit worth 20% of its price.

BEFORE YOU ASK, AND BEFORE YOU SIGN

What we will not pretend.

No independent penetration test yet

Encryption at rest, second factor, device binding and tenant isolation are built and tested. An outside test is not done, and we will not imply it is.

Single region, manual failover

Your record is backed up off the host and a new host comes up from it — but a person starts it. So we sell you no uptime guarantee.

No native mobile app

The site app installs on a phone, works offline and syncs. There is no App Store build, and we do not claim one.

Anyone who names the limits before you sign will name the problem when it happens.

NO FORM, NO DEMO BOOKING, NO SALES PROCESS

Walk a live job before you talk to us.

1

See it now

A real programme, real notices, real money, in your browser. No signup and no card.

2

Then start free

One seat, your own tenancy, your own job. Upgrade only when it has earned it.

3

Call us last

Twenty minutes, once you already know whether you want it.
