

CONSTRUX

The record of how your asset came to exist.

One governed record from concept to the thirtieth year of operation — and every figure on it computed from that record rather than typed into it.

An AI-agent construction operating system, for businesses of every size.

WHERE THE MONEY ACTUALLY GOES

Three ways a job loses money before anyone notices.

1

A missed pay less notice

Miss the window and the application becomes payable in full. Not disputed. Payable.

2

An extension you cannot substantiate

Entitlement you cannot evidence on the day is entitlement you do not get.

3

The four-week lag

Margin erodes between the thing happening and the review that finds it.

CONSTRUX computes all three on the day they happen, not at the month end.

The notice nobody was counting.

Application 3 submitted **£2,248,650**

Withheld on the valuation **–£119,650**

Pay less notice served **inside the window**

Notified sum **£2,129,000**

Without the notice, the full £2,248,650 is payable.

The reasons sit on the record: handrail terminations not to detail, dewatering rates not agreed. The platform counted the window, drafted the notice, and priced the withholding from the valuation — on the day, from evidence already captured on site.

£119,650 protected, on one application.

THE IDEA THE WHOLE PLATFORM RESTS ON

Nothing is typed in twice, and nothing is typed in at all.

Most construction software is a set of filing cabinets that happen to share a login. A figure in the cost report is a figure somebody keyed in from somewhere else, and by the time anybody checks, the two have drifted.

CONSTRUX holds one append-only record of everything that happened. Every number on every screen is computed from that record, so it cannot disagree with itself — and every number can be walked back to the site photograph, the drawing revision or the signed instruction it came from.

Hash-chained

Every event links to the one before it. A changed record breaks the chain, visibly.

Append-only

Nothing is edited or deleted. A correction is a new event with a reason and an author.

Replayable

State is rebuilt from events, so "what did we know on the 14th?" is a question with an answer.

This is what a Golden Thread actually is.

ONE RECORD, EVERY STAGE, THIRTY YEARS

It does not hand over. It carries on.

Every other toolchain breaks here

Win the work

Tender take-off, bid/no-bid on ten factors, an adversarial review that attacks your own submission before the evaluator does.

Run the work

Cost, programme, quality, safety and the field app on one spine. Forecast final cost moves when reality does.

Keep the asset

Handover packs, O&M, lifecycle cost and the operating position — against the same record that built it.

IT KNOWS THE RULES YOU ARE JUDGED AGAINST

The law and the contract, computed.

1

Construction Act

HGCRA 1996

Payment and pay less notice windows counted from the contract's own dates. A missed window is an alarm before it is a loss, and s.108 adjudication is on the record.

2

CDM 2015

Principal Contractor

The duty set, the documents each duty needs, and who holds it. Generated from the project record, not a template somebody filled in.

3

NEC4 · JCT · FIDIC

Clause-aware

Standard-form packages with an amendment overlay, so the platform reasons about your contract as amended rather than the published one.

Jurisdiction, currency and tax are set per project and versioned, so an approval two years old can still say which rules it was made under.

Agents propose. People decide.

● No agent acts unattended

Every mandate caps at propose. A test fails if an agent grants itself more.

● Every output is attributed

Which model, which prompt, which evidence, whose approval, and what changed.

● Refusal beats invention

Asked for a number the record cannot support, it says so instead of producing one.

● Metered before it runs

The cost of an AI run is shown before you commit to it, and charged to a wallet you cap.

Why it matters

A governance decision made by a machine nobody can question is a decision you cannot defend — to a client, an adjudicator or an insurer.

So decisions are human by construction here. The agents do the reading, the drafting and the arithmetic; the authority stays with the person whose name is against it.

EVERY SIZE, SAME RECORD

From one person to a Tier 1 portfolio.

Trial Free no card 1 seat Evaluate it on a real job	Solo £100 per month 1 seat Sole traders, single-project consultants	Core Project £950 per month 10 seats SME contractors and pilot projects	Professional £2,200 per month 25 seats Multiple live packages, API access	Enterprise £6,500 per month Unlimited Tier 1, multi-portfolio, isolated tenancy
--	--	--	--	--

Invite the whole job, pay only for the roles that decide. Site, quality, design and supply-chain participants are admitted without a seat. Every package includes an AI allowance worth 20% of its monthly price.

SO YOU CAN PLAN AROUND IT

What we do not claim.

No independent penetration test yet

The controls are built and tested — encryption at rest, second factor, device binding, tenant isolation. An external test is not yet done, and we will not imply otherwise.

Single region, manual failover

The record is backed up off the host and a new host comes up from it, but somebody starts it. We do not sell an uptime guarantee we cannot yet hold.

No native mobile app

The field app is an installable progressive web app and works offline. There is no App Store build, and none is claimed.

Anyone who names the limits before you sign will name the problem when it happens.

THREE WAYS TO START

See it on a real job, today.

1

Walk the live job

A real programme, real notices, real money. No signup, no card, no sales qualification step.

2

Start free

One seat, a real tenancy, your own project. Upgrade when it has earned it.

3

Twenty minutes

Book a call when you want somebody on it. Not before.
